

A Demonstration Study

Takuya Nemoto ORCID 0009-0000-1406-0547

Method. Of 120 participants randomised, 112 were analysed and 8 were lost to follow-up.

Results. The groups differed on the primary measure, $t(28) = 2.14$, $p = .04$.

A second analysis gave $F(3, 20) = 3.10$, $p = .049$, and the association was $\chi^2(1) = 3.84$, $p = .05$.

Table 1. Mean score 3.44 ($n = 25$); control mean 3.40 ($n = 25$).
